

A working Stuart Turner model of a half-beam engine. - By Stephen Sherliker

Stephen started this project several years ago but the Covid-19 lockdown allowed him to focus on completing the model. Machined in his home workshop from castings and bar stock.

Size approx 13" long x 10" high.

A beautiful example of a model half-beam engine in full working order and finished in the correct green paint.

Working from scaled plans Stephen machined the components from stock metal to complete the model
